Telecom Project

Agile Sprint Plan: Enterprise Telecom Operations Management Platform

Application Scope: `x_telcom_ops` | **Project Type:** Scoped Application (CSA + CAD Graduation Project)

📅 Sprint Timeline

Sprint	Task Title	Target & Description
Sprint 1	Foundation & Data Model Setup	App scope, Group/Role security mapping, Custom & Task-extended tables, Form Layouts
Sprint 2	UI Behavior, Logic & Server Rules	Data validation scripts, UI/Data Policies, Core Synchronous Business Rules.
Sprint 3	Workflow Automation & Portal Build	Flow Designer workflows, Record Producers, Service Portal layout configuration.
Sprint 4	SLA Tracking, KPI Dashboards & QA	Service Level Agreements, Notification Registry, Performance Dashboards, End-to-End Testing.

🏃 Sprint 1: Foundation & Data Model Setup

Sprint Objective: Establish the scoped application framework, configure security profiles, and build the physical relational data model with appropriate form views.

Task	Title	Description	Story Points
TS-1.1	Scoped App Initialization	InitializationGenerate scoped application `x_telcom_ops` via App Engine Studio or Studio.	2
TS-1.2	Group & Role Hierarchy	Provision custom roles (`.customer`, `.complaint_agent`, `.network_engineer`, `.field_engineer`, `.operations_manager`) and tie them to designated assignment groups.	3
TS-1.3	Table Build: Standalone Data	Create `x_telcom_service_plan` and `x_telcom_customer_profile` tables with required choice lists	5

		(States, Customer Types) and auto-number schemes.	
TS-1.4	Table Build: Task Extensions	Create `x_telcom_customer_complaint`, `x_telcom_network_outage`, and `x_telcom_field_engineer_task`. **Crucial:** Extend the native `Task` table; rename default labels; reuse base fields.	8
TS-1.5	Form & Layout Design	Configure Form Layouts and Design Sections (Tabs) for all tables. Set up related lists (e.g., Complaints/Compensations under Customer Profile view).	5
TS-1.6	Security Baseline (ACLs)	Create Contextual Security Rules (ACLs). Ensure Customers see only their records, and engineering/complaint teams are restricted to their operational domains.	5

🏃 Sprint 2: UI Behavior, Logic & Server Rules

Sprint Objective: Layer data integrity rules onto your forms using UI/Data policies, build client-side form enhancements, and implement server-side logic via Business Rules.

Task	Title	Description	Story Points
TS-2.1	Client Scripting Safeguards	Write `onSubmit` Client Script on Customer Profile to validate that Mobile Numbers are numeric and ≥ 10 characters.	3
TS-2.2	Dynamic Form UI Policies	Construct UI Policies on Complaints: Make *Escalation Comments* visible/mandatory if Impact is *Critical*. Make *Related Outage* mandatory if Complaint Type is *No Network*.	3
TS-2.3	Strict Server-Side Data Policies	Deploy Data Policies forcing *Mobile Number* on Customer Table and *Description* on Complaint Table to be mandatory at the database layer.	2
TS-2.4	Dynamic Priority Matrix	Code an `onChange` Client Script on Complaint Form calculating and setting the native `Priority` integer field instantly based on changes to the *Impact Level*.	5

TS-2.5	Core Server Business Rules	Develop `Before Insert` Business Rules for field pre-population (e.g., Route complaints to *Complaint Resolution Team*, block duplicate mobile numbers via GlideRecord).	5
TS-2.6	Multi-Table Interconnectivity	Create an `After Insert` Business Rule on `x_telcom_customer_complaint` to automatically spin up a corresponding record in the core ITSM `incident` table.	8

🏃 Sprint 3: Workflow Automation & Portal Build

Sprint Objective: Build automated backend workflows using Flow Designer and create the customer-facing interface inside the Service Portal.

Task	Title	Description	Story Points
TS-3.1	Flow 1: Customer Lifecycle	Design a flow triggered by a new Customer Profile record. Automation steps: Spin up a `sys_user` account, link it back, and fire a welcome event.	5
TS-3.2	Flow 2: Operational Dispatch	Build flows for Outages & Engineer Tasks. Trigger: When an Outage is logged, auto-generate a Field Engineer Task and route it to the *Field Engineering Team*.	5
TS-3.3	Flow 3: Loop Closures	Build a workflow that monitors Field Engineer Tasks. When the task transitions to *Work Completed*, automatically advance the parent Outage state to *Resolved*.	5
TS-3.4	Portal Structure Configuration	ConfigurationProvision the custom *Telecom Customer Portal* skeleton. Structure the header, navigation settings, and clean visual themes.	3
TS-3.5	Form Intakes (Record Producers)	Build Record Producers for *Customer Registration*, *Raise Complaint*, and *Compensation Request*. Map frontend variables directly to backend table fields.	8

TS-3.6	Customer Portal Dashboards	Configure data tracking widgets on the Portal Home Page using *Data Table* and *Simple List* widgets to display "My Open Complaints" and "Current Outages".	5

🏃 Sprint 4: SLA Tracking, KPI Dashboards & QA

Sprint Objective: Apply Service Level Agreements, set up automated notification routing, create operations dashboards, and run an end-to-end integration test.

Task	Title	Description	Story Points
TS-4.1	Operational SLA Definition	Build engine-driven SLAs tracking Resolution targets for Complaints (ranging from 1 hour for Critical up to 24 hours for Low) and Outages.	3
TS-4.2	Event Engine Provisioning	Populate the System Event Registry (`sysevent_register`) with specific hooks (`customer.created`, `complaint.created`, `outage.created`, `engineer.assigned`).	3
TS-4.3	Outbound Email Templates	Create Email Notifications triggered via the event engine to notify end-users and agents at critical record updates.	5
TS-4.4	Management Analytics Suite	Assemble the *Telecom Operations Dashboard*. Build visual components: Open Complaints Counter, Active Outages KPI, Engineer Workload Charts.	3
TS-4.5	Peer Code Review & Clean-up	Audit the application context. Remove syntax warnings, clean up form white-spaces, ensure proper field labeling, and verify scoped containment.	3
TS-4.6	Unified Regression & Demo Test	Execute the entire 12-step validation path (Registration → Portal Login → Complaint → Incident link → Outage generation → Resolution).	5

📊 Table Creation & Team Assignment Matrix

Table Name	Database Table Name (Scope)	Table Type / Extends	Key Focus Area	Assigned To
1. Service Plan Table	`x_telcom_service_plan`	Standalone (Custom)	Cataloging mobile, broadband, and fiber tiers with monthly costing structures.	ASER
2. Customer Profile Table	`x_telcom_customer_profile`	Standalone (Custom)	Storing customer identity details and linking them to a Service Plan and `sys_user` record.	ABDO
3. Telecom Complaint Table	`x_telcom_customer_complaint`	**Extends Task Table**	Managing the complaint lifecycle. Uses out-of-the-box Task fields for *State*, *Assigned To*, and *Priority*.	OMAR
4. Network Outage Table	`x_telcom_network_outage`	**Extends Task Table**	Tracking hardware failures (e.g., tower down, fiber cut) and measuring impact severity.	MOSTAFA
5. Field Engineer Task Table	`x_telcom_field_engineer_task`	**Extends Task Table**	Dispatching physical repair work to technicians, tracking travel, and logging resolution notes.	KARIM
6. Customer Compensation Table	`x_telcom_customer_compensation`	Standalone (Custom)	Handling billing credits, refunds, or free data allocations requiring managerial approval.	SEIF
